Space Weather Forecast

Issued on Friday, 17 March 2023 at 13:29 Local

This forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: No significant activity expected.

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity has been Low over the past 24 hours with isolated Common-class flares. There are currently nine sunspot regions on the visible disc. The majority of the regions are small, weak and either stable or weakly decaying. A new spot emerging across the southeastern limb is the largest sunspot on the disc, and might be the leader spot of a more significant region which has yet to emerge. No Earth directed CME's have been observed in the past 24-hours.

Solar Wind / Geomagnetic Activity: The solar wind has been at slightly elevated levels, reaching a peak of 534km/s at 16/1325 UTC. The solar wind is declining following the enhancement attributed to coronal mass ejection) CME) arrivals at Earth on 15 Mar and a stream of fast winds from a coronal hole. The important north-south component fluctuated north/south with weak strength. Geomagnetic activity has been at Quiet levels.

Energetic Particles / Solar Radiation: The count rate of energetic particles (high energy protons) has remained close to background levels.

Four-Day Space Weather Forecast Summary

Solar Activity: Solar activity starting at Low levels with a chance of an isolated Moderate class flare, most probable from the newly emerging sunspot region in the southeast.

Solar Wind / Geomagnetic Activity: Solar winds at slightly elevated levels during Days 1-2 (17-18 Mar) under the waning influence of coronal hole high speed stream effects and CME influence from arrivals on 15th Mar. Solar winds continue to decline through Day 3 (19 Mar) to reach Low background levels. An enhancement is possible late Day 3 (19 Mar), more likely through Day 4 (20th), as connection to a new coronal hole becomes established. No Earth directed CME's are currently forecast during the period. Geomagnetic conditions are forecast to be Quiet, with a chance of isolated Unsettled intervals until late day 3 and through day 4. Then becoming Unsettled to Active with a slight chance of a G1/Minor Storm interval.

Energetic Particles / Solar Radiation: The count rate of energetic particles is expected to remain at or near background levels. No further significant enhancements are expected at present.

Space Weather Forecast

Geomagnetic Storms:

Geo-Magnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	1	1	1	10
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X Ray Flares:

X Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 M Class	No	20	20	30	20
Very Active	R3 to R5 X	No	1	1	1	1

Solar Radiation Storms - (High Energy Protons):

Radiation Storms Probability (Exceedance)	Level (cm^{-2} sr^{-1} s^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	≥ S1	No	5	1	1	1
Very Active	≥ S3 *	No	1	1	1	1

* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)
